Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 11, Application US/08905310
Patent No. 6077939
EACHEL No. 6077939
APPLICANT: Wei, Ziping
APPLICANT: Wei, Ziping
APPLICANT: Menon-Rudolph, Sunitha
APPLICANT: Ghosh-Dastidar, Pradip
TITLE OF INVENTION: Polypeptides Having a Single Covalently Bound
TITLE OF INVENTION: N-Terminal Water-Soluble Polymer, and Related Methods,
TITLE OF INVENTION: Compositions and Kits
FILE REFERENCE: SEQUENCE LIGTING ORT 843
CURRENT APPLICATION NUMBER: US/08/905,310
CURRENT FILING DATE: 1997-08-01
NUMBER OF SEQ ID NOS: 12
SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes a method (M1) for the isolation of a subset of peptides from a protein peptide mixture (P1). M1 involves: (a) subset of peptides from a protein peptide mixture (P1). M1 involves: (a) subset of peptides via chromatography, (b) chemically, or enzymatically, or chemically and conzymatically, altering at least one amino acid of a least one of the peptides in each fraction, thereby generating a subset of altered constraints of peptides out of each fraction via chromatography, where the chromatography of steps (a) and (c) is olating the altered (fragged) peptides out of each fraction via chromatography, where the chromatography of steps (a) and (c) is performed with the same type of chromatography of steps (a) and (c) is performed with the same type of chromatography of steps (a) and (c) is performed with the same type of chromatography of steps (a) consistence, the absence or a variation in expression level of at least one protein marker or a specific set of proteins indicative of a disease protein marker or a specific set of proteins indicative of a disease consistence, M1 can be used for identifying target proteins present in metastatic and invasive cancers, in differential expression of proteins in transgenic mice, identification of proteins that are upregulated or down regulated in disease tissues, in identification of intracellular changes in cells with physiological changes such as metabolic shift, in the identification of biomarkers in cancers and in the identification of signally markers in cancers and in the identification of chomatography and without the use of affinity tags. ABP7414 to ABP75190 invariant peptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Proteome analysis; isolation; determination; diagnostic assay; detection; protein marker; identification; metastatic; invasive cancer; differential expression; signalling pathway; chromatography.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Method for isolation of peptides from complex mixture of peptides involves specific chemical and/or enzymatic alteration of at least one type of peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (VLAA-) VLAAMS INTERUNIVERSITAIR INST BIOTECHNOG.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                               Cyclophilin B; human; tumour antigen peptide; cytotoxic T-oell; CTL; HLA antigen; diagnosis; tumour; therapy.

```
neutralisation epitopes which may be used in an antigenic conjugate linked to purified outer membrane proteosome of Neisseria. This conjugate may be used in an AIDS vaccine which may be used pre- and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447 antibody). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New conjugates for treating or preventing HIV infection - comprising HIV-specific neutralisation epitopes covalently linked to outer membrane proteosome of Neisseria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR47668-788 are HIV-specific selected principal
                                                                                                                     This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIV-specific, principal neutralisation, epitope, antigen, conjugate, outer membrane proteosome; Neisseria, AIDS, vaccine, HIV; infection, disease, antibody, human, monoclonal antibody, 447 antibody.
                       Tumor antigen peptides derived from cyclophilin B for treatment and diagnosis of tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for the detection of antigen specific Teclls in a blood sample involving the use of a plurality of antigenic peptides. The method comprises sampling of peripheral blood monocytes, stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells, and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer as it can be used in semi-used for cancer vaccine therapy for patients with cervical or prostate answer. The method can additionally be used to monitor of cellular immunity and cancer immune therapy by detection of specific T-cell frequencies. Sequences ABR84136 represent HiA-A2 (human frequencies. Bequences of human origin used in an example from the
                                                                                                                                                                                                                                       A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries.

VCAM-1 recognises and binds to the integrin alpha-4beta-1 (1A4B1, or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds.

Capable of blocking they stracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within the distinct IA4B1-binding sites have been identified within all isoforms; two others (CS1 and GS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IAAB1 and contains the tripeptide LDV as its minimal active site.

Peptides AAR95704-805 are modeled after a portion of the CS1 peptide that conclude the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding
